<tr><td>Course objective</td><td>1. The aim of the course is to enable PhD students to acquire comprehensive knowledge in the field of computational fluid dynamics.</td></tr>
<tr><td>Learning outcomes</td><td>After completing the course a PhD student can:

1. select equations of fluid dynamics for complex flow problems – outcome W4, U4

2. characterize methods of turbulent flow simulations and select them for various flows – outcome W4, U4

3. characterize the finite volume method and determine the discretization uncertainty – outcomes W4, U4

4. build numerical models, solve, validate and verify as well as interpret and analyze simulation results for complex fluid flow problems – outcomes W4, U4, K1</td></tr>
<tr><td>Assessment methods</td><td>Effects W4, U4, K1 - project execution, participation in discussions during meetings with the instructor, final presentation of the project.

The final grade consists of: design execution - 50%; discussion - 25%; final presentation of the project - 25%.

The PhD student passes the course provided that he/she passes 60% threshold, while for each assessment method the PhD student has to achieve at least 50% of its score.</td></tr>
<tr><td>Prerequisites</td><td>Knowledge of fluid dynamics to characterize phenomena and conduct a basic analysis of the results of internal and external fluid flow problems.

Ability to use CAD software to prepare complex geometric models.</td></tr>
</table>

	Ability to use CFD software available at the university to define, solve and present results of simple flow problems.
Course content with delivery methods	PROJECT 1. Definition and analysis of complex fluid flow problems. Selection of fluid dynamics equations. 2. Preparation and simulations of complex fluid flow problems: preparation of geometry, mesh generation, task definition, simulations. 3. Verification and validation of simulation results. The mesh independence analysis. 4. Presentation and analysis of simulation results.
